# Aims and Objectives

A decorative header image showing a portion of a document with the Laplace Transform formula: 
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$$

Laplace-Trans

- จุดมุ่งหมาย
  - เพื่อให้ผู้เรียนมีความรู้พื้นฐานทางคณิตศาสตร์ที่จำเป็นสำหรับการเรียนในวิชาต่างๆ เกี่ยวกับเทคโนโลยีสารสนเทศ
- วัตถุประสงค์
  - มีการประยุกต์ใช้ซอฟต์แวร์ที่เหมาะสมนอกเหนือจากการคำนวณแบบธรรมดา เพื่อให้ผู้เรียนสามารถประยุกต์ความรู้ที่ได้เรียนในการแก้ปัญหาทางเทคโนโลยีสารสนเทศได้

# Topics and Details of 17 Weeks

# Course Evaluation and Evaluation Criteria

$$\text{Laplace-Trans} \\ F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$$

## Class Participation and Activities

- Participation
- Homework
- Quiz

## Midterm Examination

## Final Examination

- Each homework is assigned on **Microsoft Teams every Tuesday at 11 AM** and is worth **1 point**.
- The due date is **Sunday at 5 PM**:
  - ❖ You may receive **1 point if completed on time**, including resubmissions or re-turned in after the due date.
  - ❖ If submitted or turned in **after the due date**, you will receive **0.5 points**.
- The close date is **Monday at 5 PM**:
  - You cannot submit or turn in **after the close date** and will receive **0 points**.

# Course Assessment

Laplace-Trans  
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$$

| Description | Grade |     | Score (points) |
|-------------|-------|-----|----------------|
| Excellent   | A     | 4.0 | 80-100         |
| Very Good   | B+    | 3.5 | 75-79          |
| Good        | B     | 3.0 | 70-74          |
| Fairly Good | C+    | 2.5 | 65-69          |
| Fair        | C     | 2.0 | 60-64          |
| Poor        | D+    | 1.5 | 55-59          |
| Very Poor   | D     | 1.0 | 50-54          |
| Fail        | F     | 0.0 | 0-49           |

# What Is Linear Algebra?

A decorative image in the top right corner showing a blurred mathematical formula for the Laplace Transform:  $F(p) = \int_0^{\infty} e^{-pt} f(t) dt$ .
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt$$

- The most fundamental theme of linear algebra is the theory of systems of linear equations.
- You have probably encountered small systems of linear equations in your previous mathematics courses.
- For example, suppose you travel on an airplane between two cities that are 5000 kilometers apart.
- If the trip one way against a headwind takes 6.25 hours and the return trip the same day in the direction of the wind takes only 5 hours, can you find the ground speed of the plane and the speed of the wind, assuming that both remain constant?

# What Is Linear Algebra? (cont.)

Laplace-Trans  
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$$

The lines intersect at (900, 100).

- If you let  $x$  represent the speed of the plane and  $y$  the speed of the wind, then the following system models the problem.
$$6.25(x - y) = 5000$$
$$5(x + y) = 5000$$
- This system of two equations and two unknowns simplifies to
$$x - y = 800$$
$$x + y = 1000.$$
- and the solution is  $x = 900$  kilometers per hour and  $y = 100$  kilometers per hour.
- Geometrically, this system represents two lines in the  $xy$ -plane.
- You can see in the figure that these lines intersect at the point (900, 100) which verifies the answer that was obtained.

# What Is Linear Algebra? (cont.)

A decorative image in the top right corner showing a close-up of a document with the Laplace Transform formula:  $F(p) = \int_0^{\infty} e^{-pt} f(t) dt$ . The text "Laplace-Trans" is also visible above the formula.
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt$$

- Solving systems of linear equations is one of the most important applications of linear algebra.
- It has been argued that the majority of all mathematical problems encountered in scientific and industrial applications involve solving a linear system at some point.
- Linear applications arise in such diverse areas as engineering, chemistry, economics, business, ecology, biology, and psychology.

# Linear Algebra

A decorative image in the top right corner showing a blurred mathematical formula for the Laplace Transform:  $F(p) = \int_0^{\infty} e^{-pt} f(t) dt$ .
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt$$

- **Linear algebra** is a fairly extensive subject that covers vectors and matrices, determinants, systems of linear equations, vector spaces and linear transformations, eigenvalue problems, and other topics.
- As an area of study it has a broad appeal in that it has many applications in engineering, physics, geometry, computer science, economics, and other areas.
- It also contributes to a deeper understanding of mathematics itself.

# Definition of a Matrix

Laplace-Trans  
 $F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$

- A **matrix** is a rectangular array of numbers or functions which we will enclose in brackets.
- The plural of matrix is **matrices**.

If  $m$  and  $n$  are positive integers, then an  $m \times n$  **matrix** is a rectangular array

$$\underbrace{\left[ \begin{array}{ccccc} a_{11} & a_{12} & a_{13} & \cdots & a_{1n} \\ a_{21} & a_{22} & a_{23} & \cdots & a_{2n} \\ a_{31} & a_{32} & a_{33} & \cdots & a_{3n} \\ \vdots & \vdots & \vdots & & \vdots \\ \vdots & \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & a_{m3} & \cdots & a_{mn} \end{array} \right]}_{n \text{ columns}} \left. \vphantom{\begin{array}{c} a_{11} \\ a_{21} \\ a_{31} \\ \vdots \\ \vdots \\ a_{m1} \end{array}} \right\} m \text{ rows}$$

in which each **entry**,  $a_{ij}$ , of the matrix is a number. An  $m \times n$  matrix (read “ $m$  by  $n$ ”) has  $m$  **rows** (horizontal lines) and  $n$  **columns** (vertical lines).

# Examples of Matrices

Laplace-Trans  
 $F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$

Each matrix has the indicated size.

(a) Size:  $1 \times 1$

$$[2]$$

(b) Size:  $2 \times 2$

$$\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$$

(c) Size:  $1 \times 4$

$$\left[ 1 \quad -3 \quad 0 \quad \frac{1}{2} \right]$$

(d) Size:  $3 \times 2$

$$\begin{bmatrix} e & \pi \\ 2 & \sqrt{2} \\ -7 & 4 \end{bmatrix}$$

# Definition of a Matrix (cont.)

- One very common use of matrices is to represent systems of linear equations.
- The matrix derived from the coefficients and constant terms of a system of linear equations is called the **augmented matrix** of the system.
- The matrix containing only the coefficients of the system is called the **coefficient matrix** of the system. Here is an example.

*System*

$$\begin{array}{rcl} x - 4y + 3z & = & 5 \\ -x + 3y - z & = & -3 \\ 2x & & - 4z = 6 \end{array}$$

*Augmented Matrix*

$$\left[ \begin{array}{cccc} 1 & -4 & 3 & 5 \\ -1 & 3 & -1 & -3 \\ 2 & 0 & -4 & 6 \end{array} \right]$$

*Coefficient Matrix*

$$\left[ \begin{array}{ccc} 1 & -4 & 3 \\ -1 & 3 & -1 \\ 2 & 0 & -4 \end{array} \right]$$

# Operations with Matrices

Laplace-Trans  
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$$

- Matrix Addition
- Scalar Multiplication
- Matrix Multiplication

# Matrix Addition

A decorative image in the top right corner showing a portion of a document with the Laplace Transform formula:  $F(p) = \int_0^{\infty} e^{-pt} f(t) dt$ .
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt$$

- You can **add** two matrices (of the same size) by adding their corresponding entries.

If  $A = [a_{ij}]$  and  $B = [b_{ij}]$  are matrices of size  $m \times n$ , then their **sum** is the  $m \times n$  matrix given by

$$A + B = [a_{ij} + b_{ij}].$$

The sum of two matrices of different sizes is undefined.

# Addition of Matrices

Laplace-Trans  
 $F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$

$$(a) \begin{bmatrix} -1 & 2 \\ 0 & 1 \end{bmatrix} + \begin{bmatrix} 1 & 3 \\ -1 & 2 \end{bmatrix} = \begin{bmatrix} -1+1 & 2+3 \\ 0-1 & 1+2 \end{bmatrix} = \begin{bmatrix} 0 & 5 \\ -1 & 3 \end{bmatrix}$$

$$(b) \begin{bmatrix} 0 & 1 & -2 \\ 1 & 2 & 3 \end{bmatrix} + \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} = \begin{bmatrix} 0 & 1 & -2 \\ 1 & 2 & 3 \end{bmatrix}$$

$$(c) \begin{bmatrix} 1 \\ -3 \\ -2 \end{bmatrix} + \begin{bmatrix} -1 \\ 3 \\ 2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

(d) The sum of

$$A = \begin{bmatrix} 2 & 1 & 0 \\ 4 & 0 & -1 \\ 3 & -2 & 2 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 0 & 1 \\ -1 & 3 \\ 2 & 4 \end{bmatrix}$$

is undefined.

# Scalar Multiplication

A decorative image in the top right corner showing a portion of a document with the Laplace Transform formula:  $F(p) = \int_0^{\infty} e^{-pt} f(t) dt$ .

- When working with matrices, real numbers are referred to as **scalars**.
- You can multiply a matrix  $A$  by a scalar  $c$  by multiplying each entry in  $A$  by  $c$ .

If  $A = [a_{ij}]$  is an  $m \times n$  matrix and  $c$  is a scalar, then the **scalar multiple** of  $A$  by  $c$  is the  $m \times n$  matrix given by

$$cA = [ca_{ij}].$$

You can use  $-A$  to represent the scalar product  $(-1)A$ . If  $A$  and  $B$  are of the same size,  $A - B$  represents the sum of  $A$  and  $(-1)B$ . That is,

$$A - B = A + (-1)B.$$

Subtraction of matrices

# Scalar Multiplication and Matrix Subtraction

Laplace-Trans  
 $F(p) = \int_0^{\infty} e^{-pt} f(t) dt$

For the matrices

$$A = \begin{bmatrix} 1 & 2 & 4 \\ -3 & 0 & -1 \\ 2 & 1 & 2 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 2 & 0 & 0 \\ 1 & -4 & 3 \\ -1 & 3 & 2 \end{bmatrix}$$

find (a)  $3A$ , (b)  $-B$ , and (c)  $3A - B$ .

*SOLUTION*

$$(a) \quad 3A = 3 \begin{bmatrix} 1 & 2 & 4 \\ -3 & 0 & -1 \\ 2 & 1 & 2 \end{bmatrix} = \begin{bmatrix} 3(1) & 3(2) & 3(4) \\ 3(-3) & 3(0) & 3(-1) \\ 3(2) & 3(1) & 3(2) \end{bmatrix} = \begin{bmatrix} 3 & 6 & 12 \\ -9 & 0 & -3 \\ 6 & 3 & 6 \end{bmatrix}$$

$$(b) \quad -B = (-1) \begin{bmatrix} 2 & 0 & 0 \\ 1 & -4 & 3 \\ -1 & 3 & 2 \end{bmatrix} = \begin{bmatrix} -2 & 0 & 0 \\ -1 & 4 & -3 \\ 1 & -3 & -2 \end{bmatrix}$$

$$(c) \quad 3A - B = \begin{bmatrix} 3 & 6 & 12 \\ -9 & 0 & -3 \\ 6 & 3 & 6 \end{bmatrix} - \begin{bmatrix} 2 & 0 & 0 \\ 1 & -4 & 3 \\ -1 & 3 & 2 \end{bmatrix} = \begin{bmatrix} 1 & 6 & 12 \\ -10 & 4 & -6 \\ 7 & 0 & 4 \end{bmatrix}$$

# Matrix Multiplication

A decorative image in the top right corner showing a portion of a document with the Laplace Transform formula:  $F(p) = \int_0^{\infty} e^{-pt} f(t) dt$ .

If  $A = [a_{ij}]$  is an  $m \times n$  matrix and  $B = [b_{ij}]$  is an  $n \times p$  matrix, then the **product**  $AB$  is an  $m \times p$  matrix

$$AB = [c_{ij}]$$

where

$$c_{ij} = \sum_{k=1}^n a_{ik}b_{kj} = a_{i1}b_{1j} + a_{i2}b_{2j} + a_{i3}b_{3j} + \cdots + a_{in}b_{nj}.$$

- This definition means that the entry in the  $i$ th row and the  $j$ th column of the product  $AB$  is obtained by multiplying the entries in the  $i$ th row of  $A$  by the corresponding entries in the  $j$ th column of  $B$  and then adding the results.

# Finding the Product of Two Matrices

$$\text{Laplace-Trans} \\ F(p) = \int_0^{\infty} e^{-pt} f(t) dt$$

Find the product  $AB$ , where

$$A = \begin{bmatrix} -1 & 3 \\ 4 & -2 \\ 5 & 0 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} -3 & 2 \\ -4 & 1 \end{bmatrix}.$$

**SOLUTION**

First note that the product  $AB$  is defined because  $A$  has size  $3 \times 2$  and  $B$  has size  $2 \times 2$ . Moreover, the product  $AB$  has size  $3 \times 2$  and will take the form

$$\begin{bmatrix} -1 & 3 \\ 4 & -2 \\ 5 & 0 \end{bmatrix} \begin{bmatrix} -3 & 2 \\ -4 & 1 \end{bmatrix} = \begin{bmatrix} c_{11} & c_{12} \\ c_{21} & c_{22} \\ c_{31} & c_{32} \end{bmatrix}.$$

To find  $c_{11}$  (the entry in the first row and first column of the product), multiply corresponding entries in the first row of  $A$  and the first column of  $B$ . That is,

$$\begin{bmatrix} -1 & 3 \\ 4 & -2 \\ 5 & 0 \end{bmatrix} \begin{bmatrix} -3 \\ -4 \end{bmatrix} = \begin{bmatrix} -9 & c_{12} \\ c_{21} & c_{22} \\ c_{31} & c_{32} \end{bmatrix}.$$

$c_{11} = (-1)(-3) + (3)(-4) = -9$

# Finding the Product of Two Matrices (cont.)

Laplace Transform  
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt$$

Similarly, to find  $c_{12}$ , multiply corresponding entries in the first row of  $A$  and the second column of  $B$  to obtain

$$\begin{bmatrix} -1 & 3 \\ 4 & -2 \\ 5 & 0 \end{bmatrix} \begin{bmatrix} -3 & 2 \\ -4 & 1 \end{bmatrix} = \begin{bmatrix} -9 & c_{12} \\ c_{21} & c_{22} \\ c_{31} & c_{32} \end{bmatrix}$$

$c_{12} = (-1)(2) + (3)(1) = 1$

Continuing this pattern produces the results shown below.

$$c_{21} = (4)(-3) + (-2)(-4) = -4$$

$$c_{22} = (4)(2) + (-2)(1) = 6$$

$$c_{31} = (5)(-3) + (0)(-4) = -15$$

$$c_{32} = (5)(2) + (0)(1) = 10$$

The product is

$$AB = \begin{bmatrix} -1 & 3 \\ 4 & -2 \\ 5 & 0 \end{bmatrix} \begin{bmatrix} -3 & 2 \\ -4 & 1 \end{bmatrix} = \begin{bmatrix} -9 & 1 \\ -4 & 6 \\ -15 & 10 \end{bmatrix}$$

# Matrix Multiplication (cont.)

- Be sure you understand that for the product of two matrices to be defined, the number of columns of the first matrix must equal the number of rows of the second matrix. That is,

$$\begin{array}{ccc} A & B & = AB. \\ m \times n & n \times p & m \times p \\ \uparrow \quad \uparrow \quad \uparrow & & \\ \text{equal} & & \\ \text{size of } AB & & \end{array}$$

- So, the product  $BA$  is not defined for matrices such as  $A$  and  $B$  in the previous example.

# Matrix Multiplication (cont.)

- The general pattern for matrix multiplication is as follows. To obtain the element in the  $i$ th row and the  $j$ th column of the product  $AB$ , use the  $i$ th row of  $A$  and the  $j$ th column of  $B$ .

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} & \cdots & a_{1n} \\ a_{21} & a_{22} & a_{23} & \cdots & a_{2n} \\ \vdots & \vdots & \vdots & & \vdots \\ a_{i1} & a_{i2} & a_{i3} & \cdots & a_{in} \\ \vdots & \vdots & \vdots & & \vdots \\ a_{m1} & a_{m2} & a_{m3} & \cdots & a_{mn} \end{bmatrix} \begin{bmatrix} b_{11} & b_{12} & \cdots & b_{1j} & \cdots & b_{1p} \\ b_{21} & b_{22} & \cdots & b_{2j} & \cdots & b_{2p} \\ b_{31} & b_{32} & \cdots & b_{3j} & \cdots & b_{3p} \\ \vdots & \vdots & & \vdots & & \vdots \\ b_{n1} & b_{n2} & \cdots & b_{nj} & \cdots & b_{np} \end{bmatrix} = \begin{bmatrix} c_{11} & c_{12} & \cdots & c_{1j} & \cdots & c_{1p} \\ c_{21} & c_{22} & \cdots & c_{2j} & \cdots & c_{2p} \\ \vdots & \vdots & & \vdots & & \vdots \\ c_{i1} & c_{i2} & \cdots & c_{ij} & \cdots & c_{ip} \\ \vdots & \vdots & & \vdots & & \vdots \\ c_{m1} & c_{m2} & \cdots & c_{mj} & \cdots & c_{mp} \end{bmatrix}$$

$a_{i1}b_{1j} + a_{i2}b_{2j} + a_{i3}b_{3j} + \cdots + a_{in}b_{nj} = c_{ij}$

# Matrix Multiplication

Laplace-Transform  
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$$

$$(a) \begin{bmatrix} 1 & 0 & 3 \\ 2 & -1 & -2 \end{bmatrix} \begin{bmatrix} -2 & 4 & 2 \\ 1 & 0 & 0 \\ -1 & 1 & -1 \end{bmatrix} = \begin{bmatrix} -5 & 7 & -1 \\ -3 & 6 & 6 \end{bmatrix}$$

$2 \times 3 \quad 3 \times 3 \quad 2 \times 3$

$$(b) \begin{bmatrix} 3 & 4 \\ -2 & 5 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \begin{bmatrix} 3 & 4 \\ -2 & 5 \end{bmatrix}$$

$2 \times 2 \quad 2 \times 2 \quad 2 \times 2$

$$(c) \begin{bmatrix} 1 & 2 \\ 1 & 1 \end{bmatrix} \begin{bmatrix} -1 & 2 \\ 1 & -1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

$2 \times 2 \quad 2 \times 2 \quad 2 \times 2$

$$(d) \begin{bmatrix} 1 & -2 & -3 \end{bmatrix} \begin{bmatrix} 2 \\ -1 \\ 1 \end{bmatrix} = \begin{bmatrix} 1 \end{bmatrix}$$

$1 \times 3 \quad 3 \times 1 \quad 1 \times 1$

$$(e) \begin{bmatrix} 2 \\ -1 \\ 1 \end{bmatrix} \begin{bmatrix} 1 & -2 & -3 \end{bmatrix} = \begin{bmatrix} 2 & -4 & -6 \\ -1 & 2 & 3 \\ 1 & -2 & -3 \end{bmatrix}$$

$3 \times 1 \quad 1 \times 3 \quad 3 \times 3$

# Properties of Matrix Operations

- This section begins to develop the **algebra of matrices**.
- You will see that this algebra shares many (but not all) of the properties of the algebra of real numbers.

# Properties of Matrix Addition and Scalar Multiplication

If  $A$ ,  $B$ , and  $C$  are  $m \times n$  matrices and  $c$  and  $d$  are scalars, then the following properties are true.

1.  $A + B = B + A$
2.  $A + (B + C) = (A + B) + C$
3.  $(cd)A = c(dA)$
4.  $1A = A$
5.  $c(A + B) = cA + cB$
6.  $(c + d)A = cA + dA$

Commutative property of addition

Associative property of addition

Associative property of multiplication

Multiplicative identity

Distributive property

Distributive property

# Properties of Matrix Multiplication

If  $A$ ,  $B$ , and  $C$  are matrices (with sizes such that the given matrix products are defined) and  $c$  is a scalar, then the following properties are true.

1.  $A(BC) = (AB)C$
2.  $A(B + C) = AB + AC$
3.  $(A + B)C = AC + BC$
4.  $c(AB) = (cA)B = A(cB)$

# Properties of the Identity Matrix

Laplace Transform  
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$$

- You will now look at a special type of square matrix that has 1's on the main diagonal and 0's elsewhere.

$$I_n = \begin{bmatrix} 1 & 0 & 0 & \cdots & 0 \\ 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \vdots & \vdots & \vdots & & \vdots \\ 0 & 0 & 0 & \cdots & 1 \end{bmatrix}$$

For instance, if  $n = 1, 2$ , or  $3$ , we have

$$I_1 = [1], \quad I_2 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}, \quad I_3 = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}.$$

$1 \times 1$                        $2 \times 2$                        $3 \times 3$

- When the order of the matrix is understood to be  $n$ , you may denote  $I_n$  simply as  $I$ .

# Properties of the Identity Matrix (cont.)

A decorative image in the top right corner showing a portion of a document with the Laplace Transform formula:  $F(p) = \int_0^{\infty} e^{-pt} f(t) dt$ .
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt$$

If  $A$  is a matrix of size  $m \times n$ , then the following properties are true.

1.  $AI_n = A$
2.  $I_m A = A$

As a special case of this theorem, note that if  $A$  is a *square* matrix of order  $n$ , then

$$AI_n = I_n A = A.$$

# The Transpose of a Matrix

$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$$

The **transpose** of a matrix is formed by writing its columns as rows. For instance, if  $A$  is the  $m \times n$  matrix shown by

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} & \cdots & a_{1n} \\ a_{21} & a_{22} & a_{23} & \cdots & a_{2n} \\ a_{31} & a_{32} & a_{33} & \cdots & a_{3n} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & a_{m3} & \cdots & a_{mn} \end{bmatrix},$$

Size:  $m \times n$

then the transpose, denoted by  $A^T$ , is the  $n \times m$  matrix below

$$A^T = \begin{bmatrix} a_{11} & a_{21} & a_{31} & \cdots & a_{m1} \\ a_{12} & a_{22} & a_{32} & \cdots & a_{m2} \\ a_{13} & a_{23} & a_{33} & \cdots & a_{m3} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ a_{1n} & a_{2n} & a_{3n} & \cdots & a_{mn} \end{bmatrix}.$$

Size:  $n \times m$

# The Transpose of a Matrix (cont.)

Laplace-Trans  
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$$

Find the transpose of each matrix.

$$(a) A = \begin{bmatrix} 2 \\ 8 \end{bmatrix} \quad (b) B = \begin{bmatrix} 1 & 2 & 3 \\ 4 & 5 & 6 \\ 7 & 8 & 9 \end{bmatrix} \quad (c) C = \begin{bmatrix} 1 & 2 & 0 \\ 2 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad (d) D = \begin{bmatrix} 0 & 1 \\ 2 & 4 \\ 1 & -1 \end{bmatrix}$$

*SOLUTION* (a)  $A^T = [2 \quad 8]$  (b)  $B^T = \begin{bmatrix} 1 & 4 & 7 \\ 2 & 5 & 8 \\ 3 & 6 & 9 \end{bmatrix}$  (c)  $C^T = \begin{bmatrix} 1 & 2 & 0 \\ 2 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$

$$(d) D^T = \begin{bmatrix} 0 & 2 & 1 \\ 1 & 4 & -1 \end{bmatrix}$$

- Note that the square matrix in part (c) of the above example is equal to its transpose.
- Such a matrix is called **symmetric**.
- A matrix  $A$  is symmetric if  $A = A^T$ . From this definition it is clear that a symmetric matrix must be square. Also, if  $A = [a_{ij}]$  is a symmetric matrix, then  $a_{ij} = a_{ji}$  for all  $i \neq j$ .

# Properties of Transposes

A decorative image in the top right corner showing a portion of a document with the Laplace Transform formula:  $F(p) = \int_0^{\infty} e^{-pt} f(t) dt$ .
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt$$

If  $A$  and  $B$  are matrices (with sizes such that the given matrix operations are defined) and  $c$  is a scalar, then the following properties are true.

1.  $(A^T)^T = A$  **Transpose of a transpose**
2.  $(A + B)^T = A^T + B^T$  **Transpose of a sum**
3.  $(cA)^T = c(A^T)$  **Transpose of a scalar multiple**
4.  $(AB)^T = B^T A^T$  **Transpose of a product**

# The Product of a Matrix and Its Transpose

For the matrix

$$A = \begin{bmatrix} 1 & 3 \\ 0 & -2 \\ -2 & -1 \end{bmatrix}$$

find the product  $AA^T$  and show that it is symmetric.

**SOLUTION**

Because

$$AA^T = \begin{bmatrix} 1 & 3 \\ 0 & -2 \\ -2 & -1 \end{bmatrix} \begin{bmatrix} 1 & 0 & -2 \\ 3 & -2 & -1 \end{bmatrix} = \begin{bmatrix} 10 & -6 & -5 \\ -6 & 4 & 2 \\ -5 & 2 & 5 \end{bmatrix}$$

it follows that  $AA^T = (AA^T)^T$ , so  $AA^T$  is symmetric.

# Q & A

Laplace-Trans  
$$F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$$

The image shows a close-up of a document with the Laplace transform formula. The text 'Laplace-Trans' is partially visible at the top. Below it, the formula  $F(p) = \int_0^{\infty} e^{-pt} f(t) dt,$  is written in a serif font. The document is slightly tilted and has a light gray background.
